Caterpillar

**LIFE STAGES
OF A
BUTTERFLY**

**Cocoon
(pupa)**

Butterfly

Talk about the life cycle of a butterfly above and then cut out the different descriptions and put below with the pictures.

The eggs are laid on plants by the female butterfly

The egg hatches into a caterpillar and the caterpillar eats and eats and will start to hang upside down

The caterpillar wraps himself into a cocoon which is called the pupa stage - the cocoon then change.

The cocoon then grows and forms into a butterfly, it wiggles out of the cocoon and flys away
